240 pictures and matching sentences

12 pictures on each full picture page

Name: _____

1

Mia builds 345 with base-ten blocks for a pretend city.

2

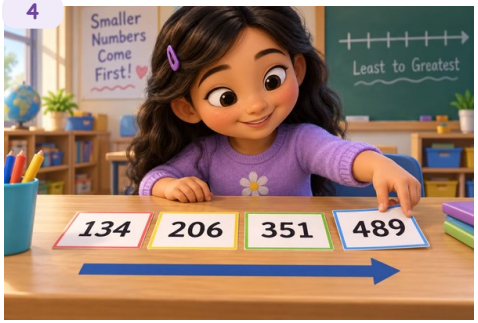

Ben writes 672 in the correct columns of a place-value chart.

3

Peter spots the zero tens while building 508 on his chart.

4

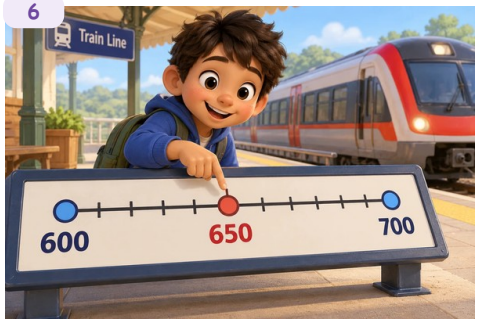

Luna slides four number cards, 134, 206, 351, and 489, from least to greatest.

5

Chloe explains why 132 is greater than 123 using the tens digits.

6

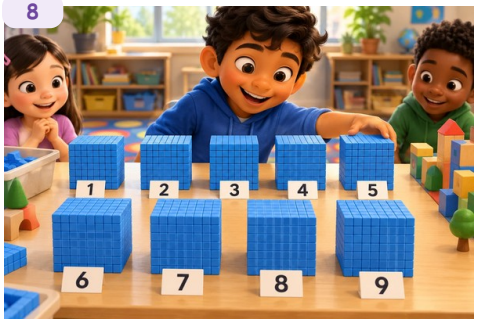

Oliver finds the halfway stop between 600 and 700 on a train line.

7

Amara estimates how many colourful cubes fill the glass jar.

8

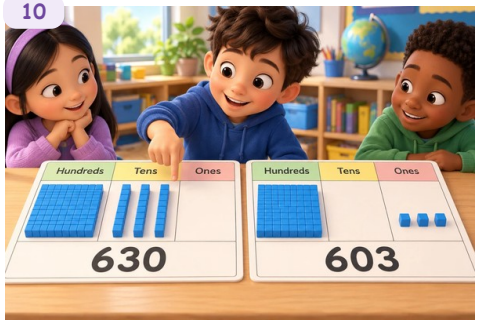

Mateo counts nine groups of one hundred blocks for a block city.

9

Priya joins nine hundreds to make 900 on her building mat.

10

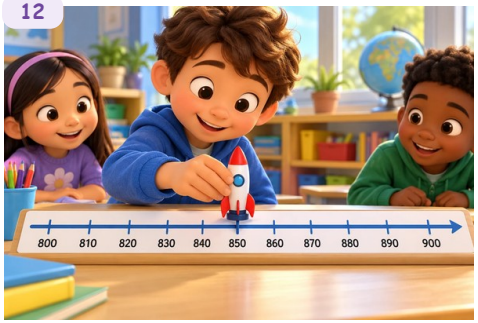

Jackson compares 630 and 603 to explain the different tens values.

11

Fatima explains why the 2 in 128 stands for twenty.

12

Ethan parks his rocket marker at 850 on the number line.

13

Sofia opens number flaps to split 586 into 500, 80, and 6.

14

Noah compares two different place-value models for the same number.

15

Isabella builds 999 with nine hundreds, nine tens, and nine ones.

16

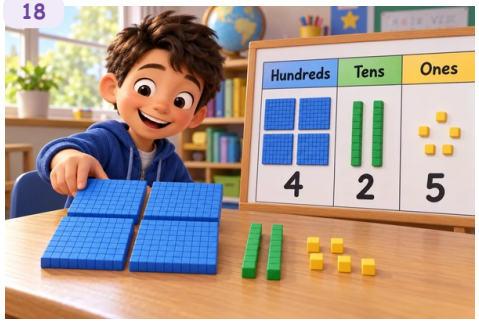

Kai flips number cards while counting by twenty-fives.

17

Fatima counts backward by fifties from 700 on a snowy trail.

18

Henry writes 425 as four hundreds, two tens, and five ones.

19

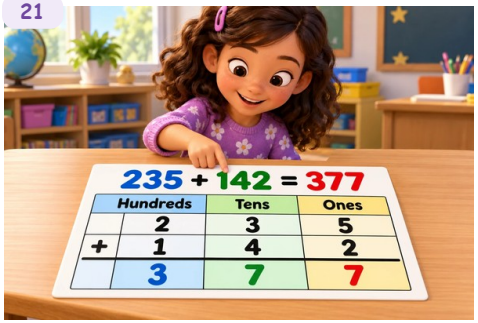

Chloe finds the number one hundred more than 365 on her chart.

20

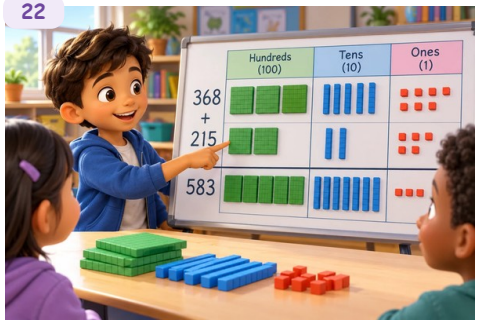

Amir compares three numbers by checking their place-value columns.

21

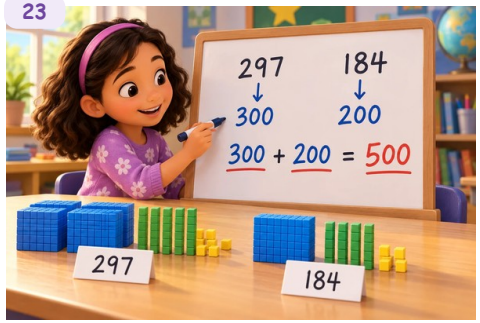

Ruby joins 235 and 142 on a place-value chart to find the sum.

22

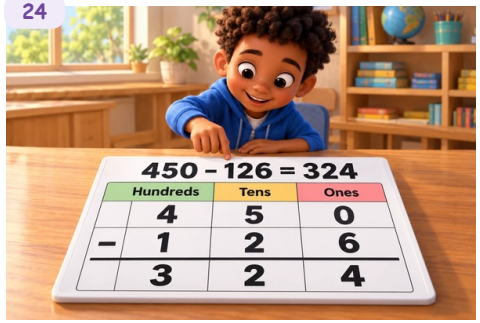

Lucas shows his strategy for adding 368 and 215.

23

Hannah rounds the numbers to estimate the sum of 297 and 184.

24

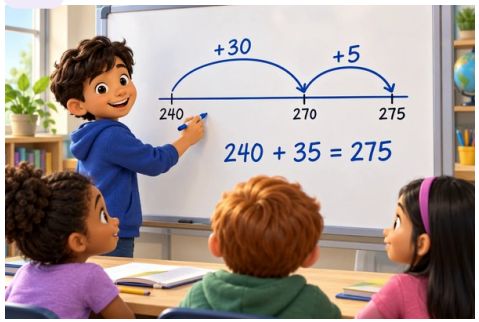

Isaac takes 126 from 450 using a place-value chart.

25

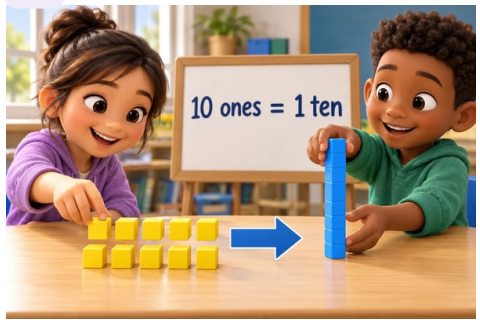

Anika uses her counter groups to check an addition answer.

26

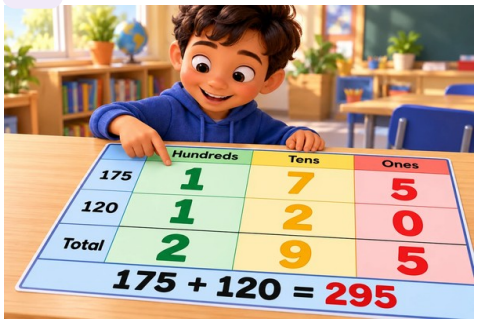

Caleb draws jumps of thirty and five to add 35 to 240.

27

Kai explains why ten tiny ones can become one long ten-rod.

28

David adds 175 and 120 with a colourful place-value mat.

29

Nia regroups blocks to take 245 away from 600.

30

Aiden shows each step of his addition strategy with number cards.

31

Alex multiplies three equal groups of five blue bridge blocks.

32

Mason builds a block array with three straight rows of six.

33

Emily writes a multiplication sentence for three rows of four counters.

34

Adam skip-counts to find the total in six groups of four.

35

Nora sketches five groups of three blocks for a pretend playground.

36

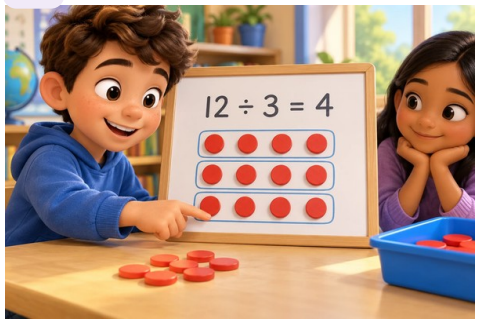

Ryan shares twenty-four counters fairly among four friends.

37

Sarah divides eighteen cubes into three equal picnic groups.

38

Alex uses equal rows in an array to explain division.

39

Ben explains twelve divided by two using his toy garages.

40

Nathan adds four groups of five to find the total.

41

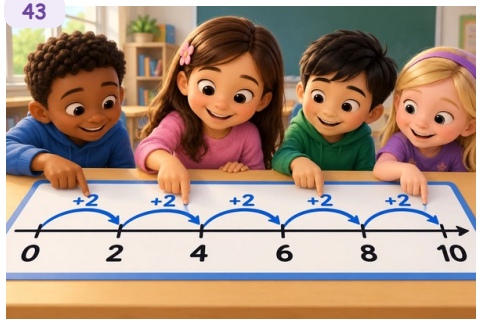

Jasmine counts two rows of eight bright blocks.

42

Owen repeatedly takes away equal groups to divide twenty counters.

43

Aaliyah explains how equal jumps of two show repeated addition.

44

Daniel spots number patterns on his multiplication chart.

45

Amelia explains why three groups of four make twelve altogether.

46

Sebastian builds five rows of six to model five times six.

47

Anika shares thirty blocks equally across five trays.

48

Elijah skip-counts by fives to solve six times five.

49

Maya uses matching groups to connect multiplication and division.

50

Nathan checks his multiplication using the straight rows of cubes.

51

Gabriela shades one-third of a paper rectangle for a flag.

52

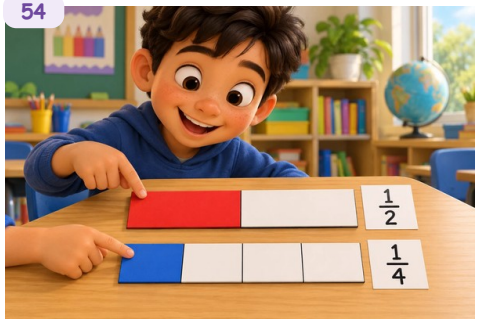

Enzo splits a bright shape into six equal parts.

53

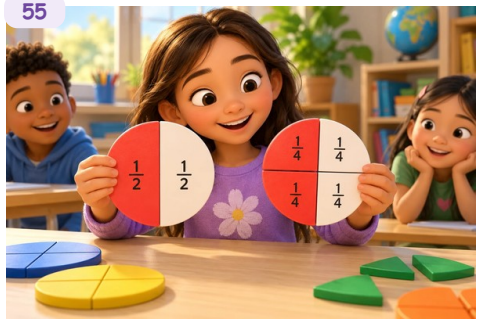

Melissa colours three of four equal parts on her rectangle.

54

Bryan compares one-half and one-fourth with equal-length fraction strips.

55

Grace finds two fraction models that cover the same amount.

56

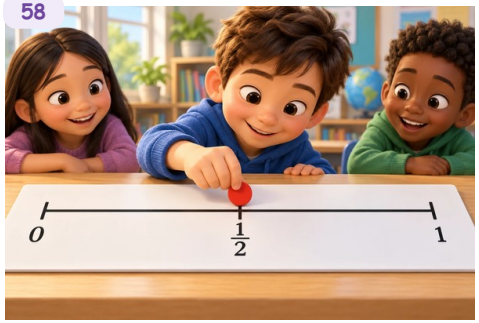

Leonardo colours two-fourths of a round fraction model.

57

Micaella folds a paper strip into eight equal parts.

58

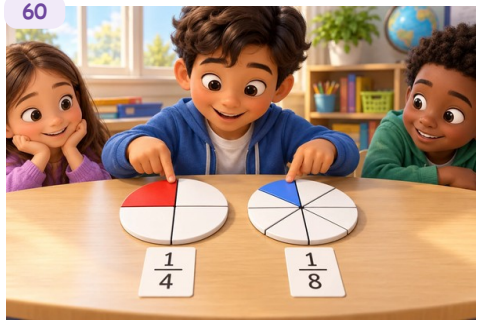

Iliya slides a marker halfway between zero and one.

59

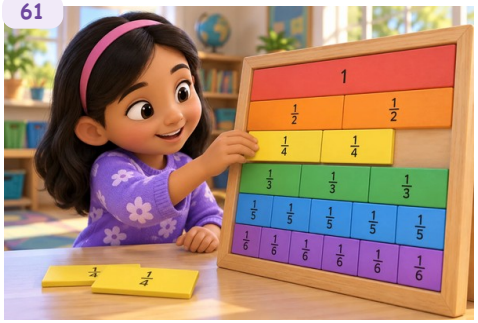

Ava shades three-fifths of a bright rectangular flag.

60

Christian compares two unit fractions with equal-sized picture models.

61

Ashleen matches two-fourths to one-half on her fraction wall.

62

Veronica joins four fourths to make one whole strip.

63

Leah colours three-eighths of a paper fraction strip.

64

Paige places one-quarter on a number line between zero and one.

65

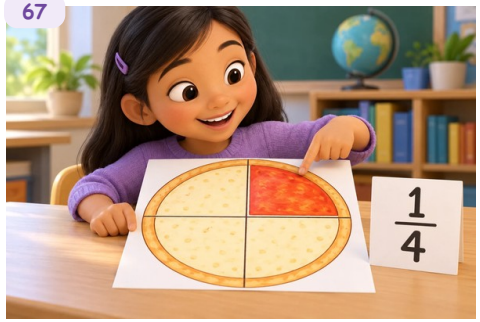

Luka compares fractions with the same denominator on matching strips.

66

Arya folds paper to prove that two fractions are equal.

67

Hannah explains why one coloured pizza wedge represents one-fourth.

68

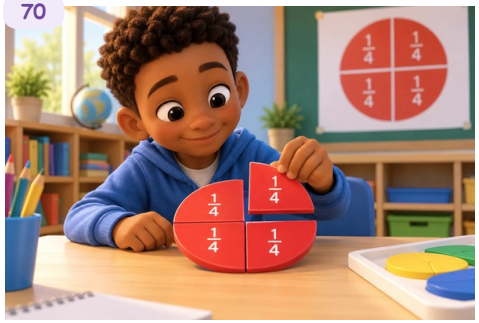

Davyd joins colourful fraction tiles to build one whole.

69

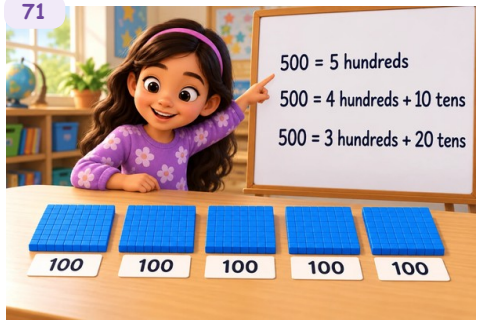

Amy colours two-thirds of a paper strip for a kite tail.

70

Marcus checks that every part is equal in his fraction model.

71

Mia finds different block combinations that each make 500.

72

Ben leaves the tens space empty while modelling 706.

73

Peter counts forward by hundreds from 250 along a number track.

74

Luna finds the missing train card between 678 and 680.

75

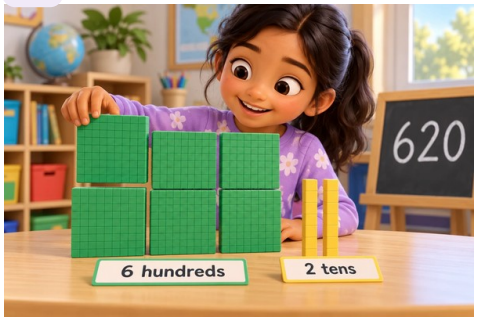

Aaliyah orders six number cards between 400 and 900.

76

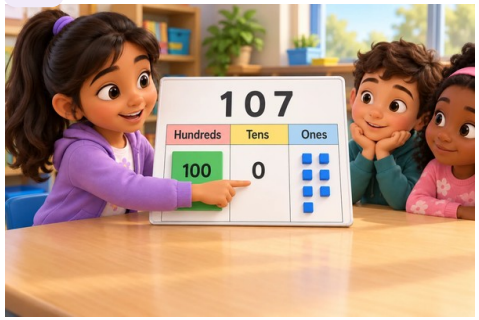

Oliver compares the tens digits in 809 and 890.

77

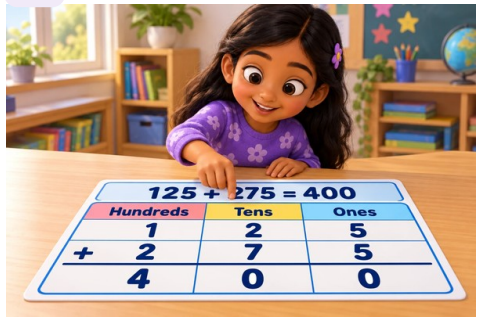

Zara builds 620 with six hundreds and two tens.

78

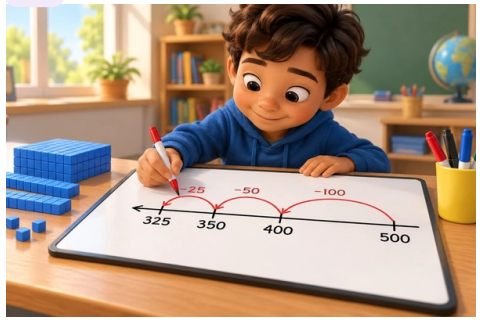

Ashleen explains why 107 has an empty tens column.

79

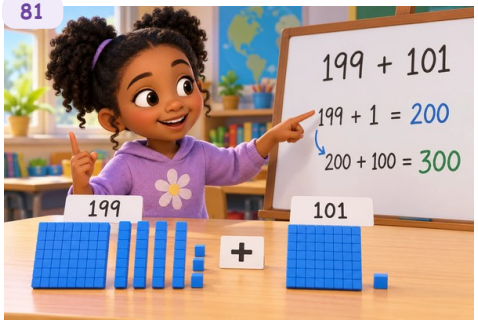

Priya joins 125 and 275 on a place-value mat.

80

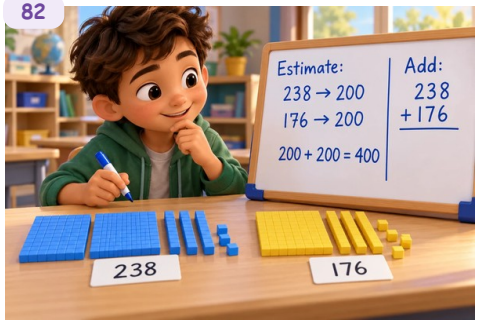

Jackson draws backward jumps to take 175 away from 500.

81

Amara uses a quick mental strategy to add 199 and 101.

82

Ethan estimates the sum before solving his addition problem.

83

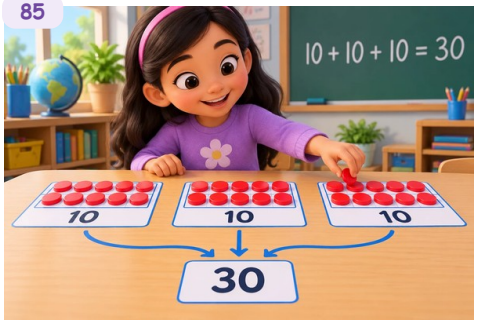

Leo uses his block model to check his calculation.

84

Noah solves a story problem about collecting 325 shiny stickers.

85

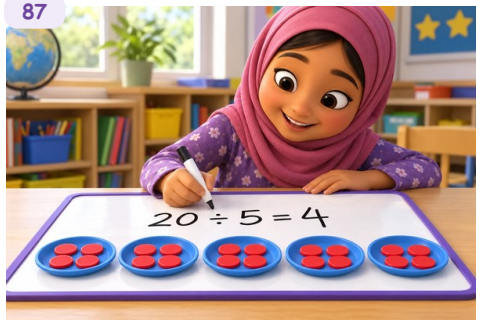

Isabella adds three groups of ten bright counters.

86

Kai builds an array with four rows of five cubes.

87

Fatima writes twenty divided by five equals four beneath her equal groups.

88

Henry counts the cubes in a five-by-five square array.

89

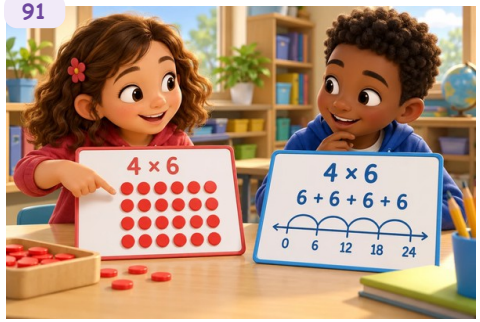

Chloe draws ten groups of three stars for a class display.

90

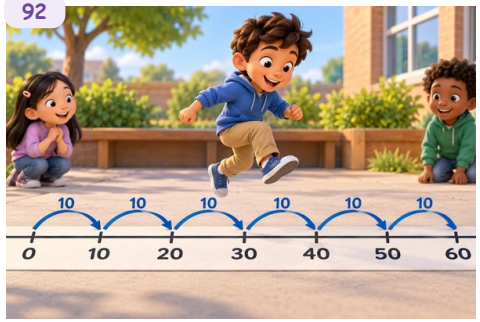

Amir clicks cubes into three equal groups of eight.

91

Ruby compares two multiplication strategies with a classmate.

92

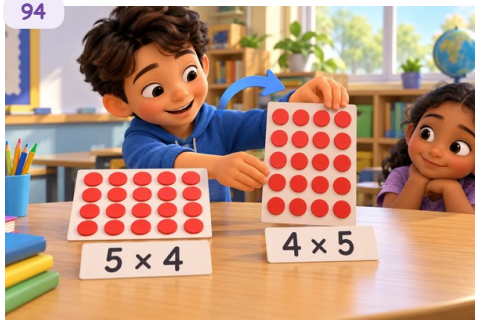

Lucas makes six jumps of ten along a number line.

93

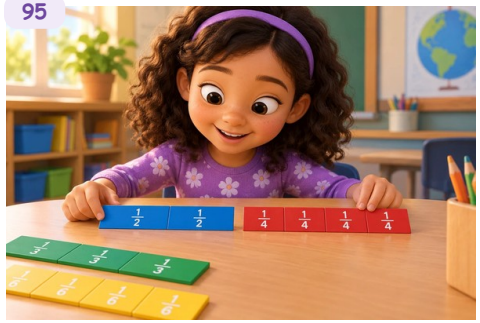

Hannah shares forty counters equally across five trays.

94

Isaac turns an array to connect five times four and four times five.

95

Zoe builds two equal fractions with different fraction strips.

96

Mia explains why five strawberries are half of ten.

97

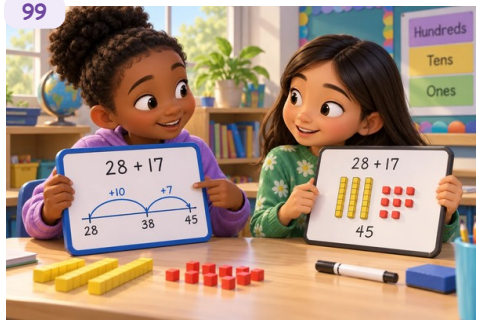

Aria draws equal parts to explain her fraction.

98

David solves a number story with blocks and a careful drawing.

99

Nia compares her solution with a friend's different strategy.

100

Aiden explains his block model with clear mathematical words.

101

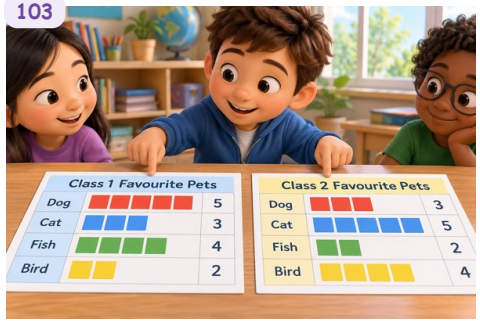

David compares the books his friends read for a reading challenge.

102

Ben creates a frequency table of favourite sports.

103

Peter compares survey results from two classrooms.

104

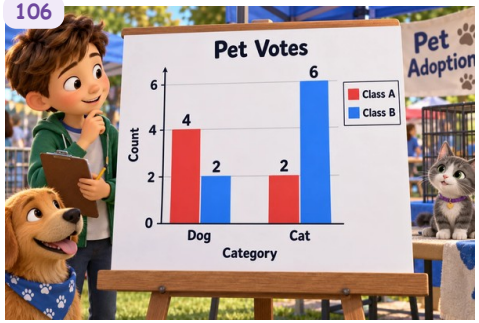

Bella compares the survey results represented by the block columns.

105

Aaliyah uses two colours to represent two classes.

106

Oliver labels both axes of his multiple-bar graph.

107

Luna explains how five blocks represent five survey votes.

108

Nathan compares snack frequencies recorded in his class table.

109

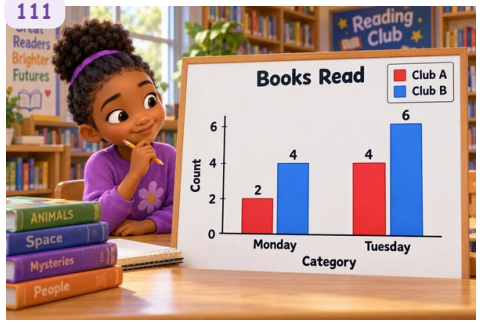

Isabella explains the frequencies shown by the pet line plot.

110

Isla records each result with an X above its number.

111

Amara checks the scale on her multiple-bar graph.

112

Ethan compares two classes' reading totals across two weeks.

113

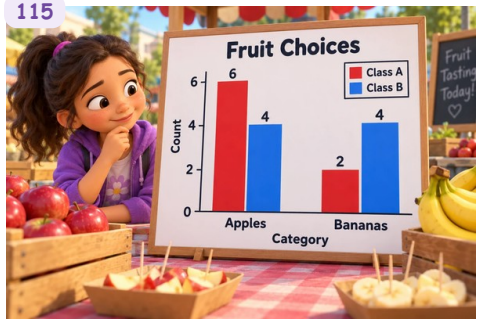

Sofia records how many minutes children spend reading.

114

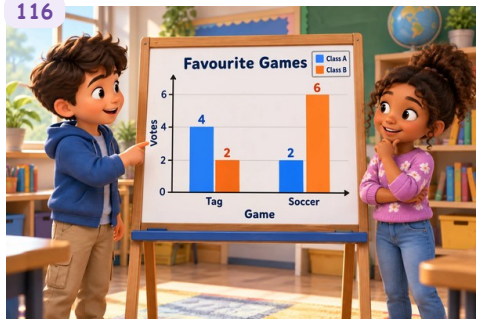

Noah creates two bars for each sport on his multiple-bar graph.

115

Zoe compares fruit choices from two classes on a multiple-bar graph.

116

Kai uses a graph to compare two sets of survey results.

117

Mia compares the colour and shape groups in her button survey.

118

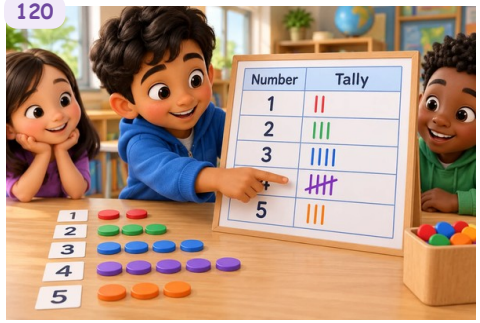

Henry follows tree branches to sort different coloured shapes.

119

Chloe records the number of goals scored in each game.

120

Amir finds the most common number in his data.

121

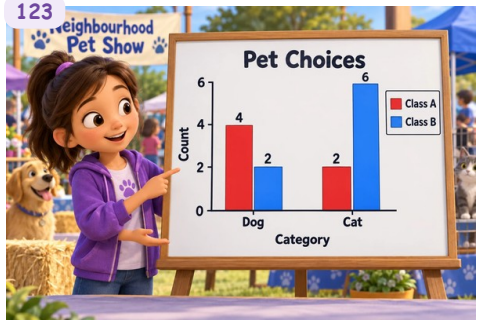

Aaliyah records the frequency of each pet choice during her survey.

122

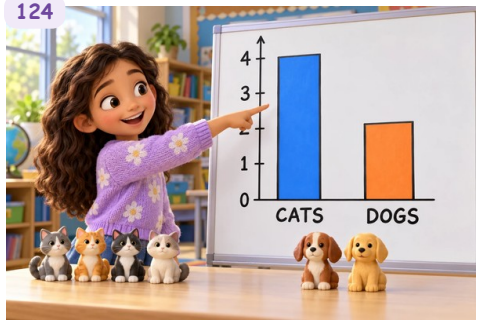

Lucas creates a multiple-bar graph comparing Grade 2 and Grade 3 students.

123

Hannah explains what each colour represents on her multiple-bar graph.

124

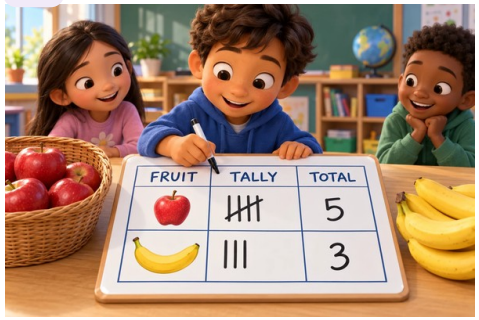

Sofia explains the difference between four cat votes and two dog votes.

125

Zoe asks which class collected more recyclable containers.

126

Peter checks the fruit tally totals before drawing a graph.

127

Oliver counts each pet picture to record its frequency.

128

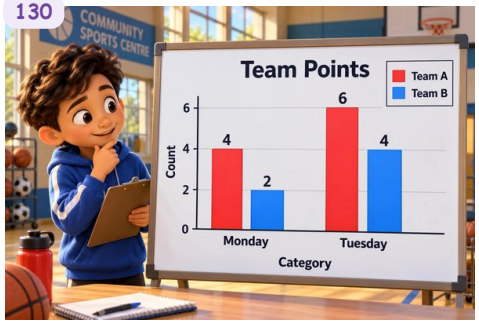

David organizes the results of a classroom experiment.

129

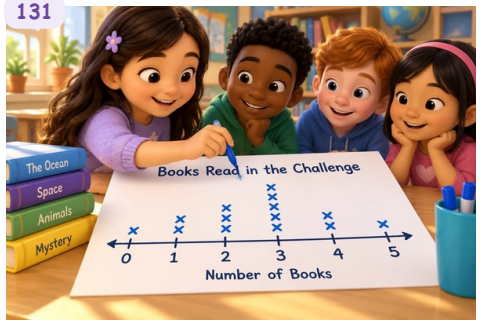

Nia counts how many times each result occurs.

130

Aiden uses a multiple-bar graph to compare two teams.

131

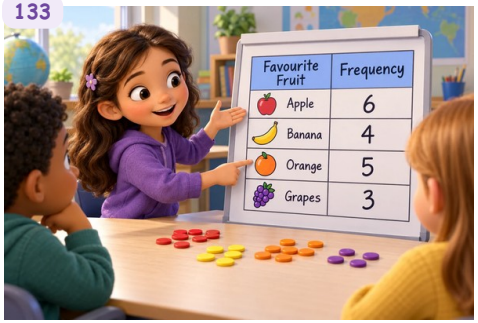

Amelia compares the frequencies in her reading-challenge line plot.

132

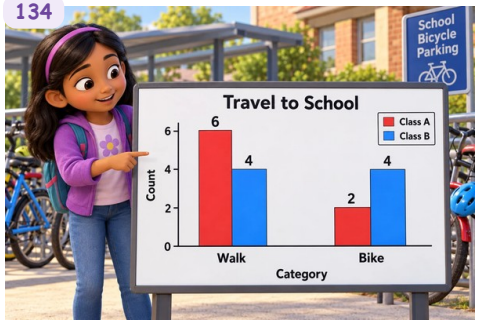

Mason notices that three students have the same number of stickers.

133

Isla explains why a frequency table is useful.

134

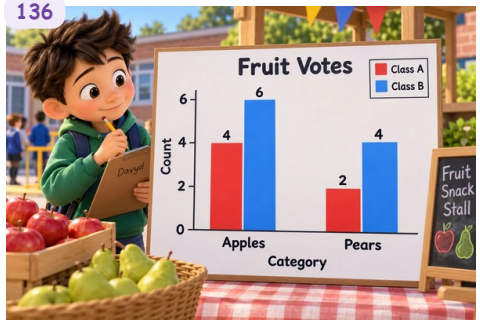

Anika explains how category labels help readers interpret a multiple-bar graph.

135

Sebastian chooses a clear title for his multiple-bar graph.

136

Davyd checks that his multiple-bar graph represents every class vote.

137

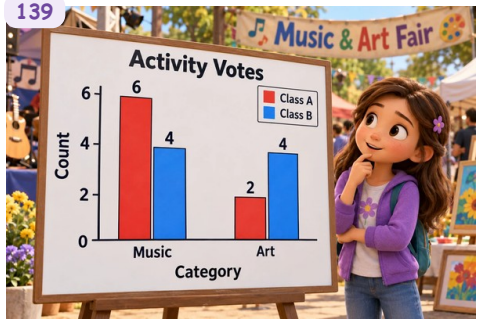

Sarah explains why one class borrowed more books than the other.

138

Noah looks for a pattern in his class season survey.

139

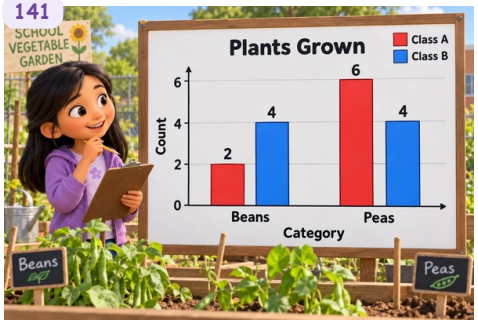

Anastasiia identifies the most frequent choice across two class surveys.

140

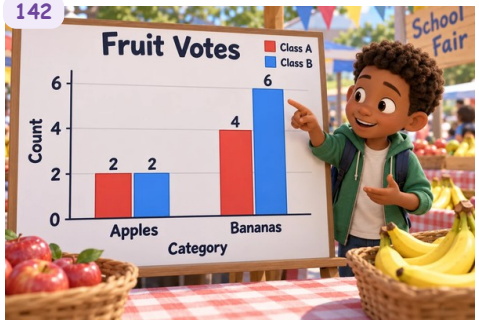

Grace compares bean and sunflower seedlings in two garden beds.

141

Jasmine uses a multiple-bar graph to compare plants grown by two classes.

142

Caleb explains why two fruit bars have equal frequencies on his multiple-bar graph.

143

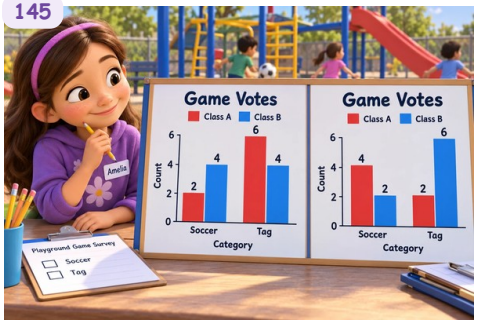

Jackson compares how often friends use each way of travelling to school.

144

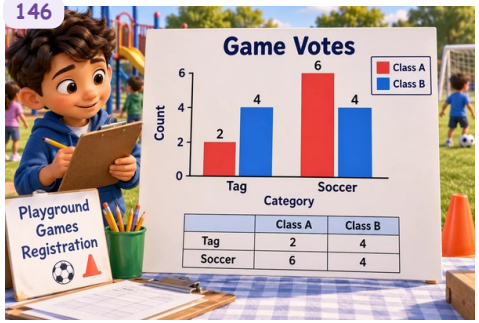

Daniel uses data to recommend a playground activity.

145

Amelia compares two multiple-bar graphs showing different survey results.

146

Caleb checks each multiple-bar graph bar against its matching tally total.

147

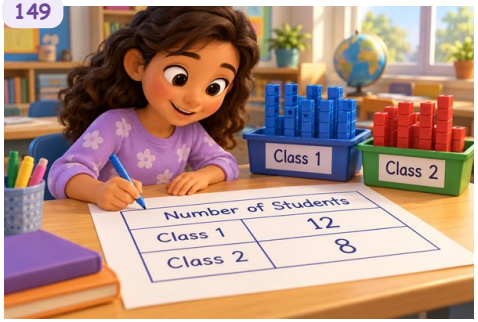

Nia explains what the class survey revealed about favourite books.

148

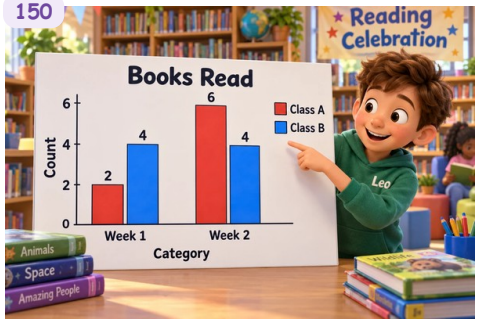

Aiden presents an infographic with a multiple-bar graph and clear conclusions.

149

Maya creates a table using information from two classrooms.

150

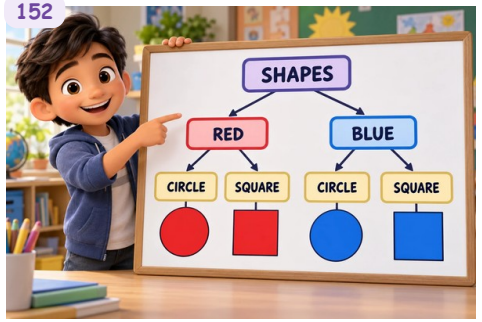

Leo explains how his multiple-bar graph compares the classes.

151

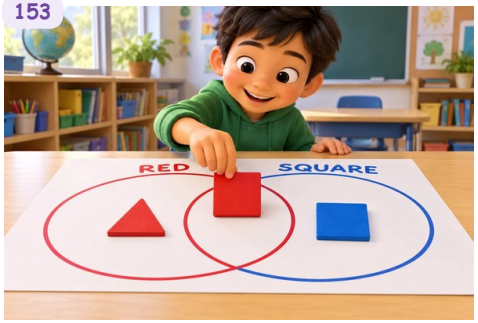

Mateo compares the size and colour groups of the toy cars.

152

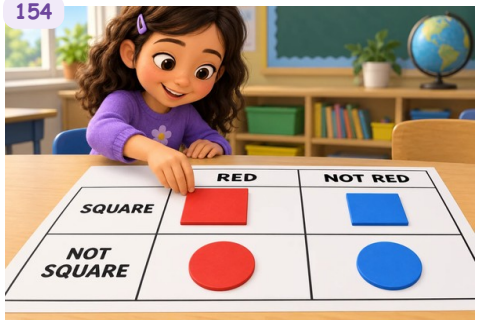

Enzo follows tree branches to sort red and blue circles and squares.

153

Lucas explains how overlapping circles show red shapes and squares.

154

Nora explains how the Carroll diagram sorts shapes into four groups.

155

Ruby checks the size, shape, and colour of each sorted object.

156

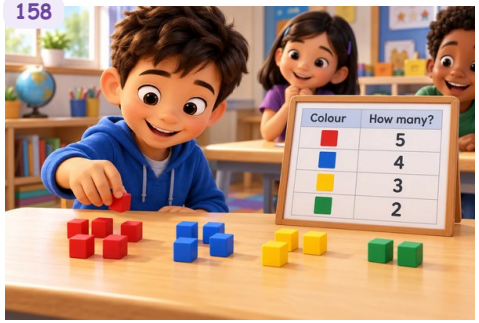

Kai checks that each button belongs in its correct sorting group.

157

Amara checks the frequency represented by ten sticker tallies.

158

Ethan compares how often each cube colour appears.

159

Ava explains why 3 is the mode of 2, 3, 3, and 5.

160

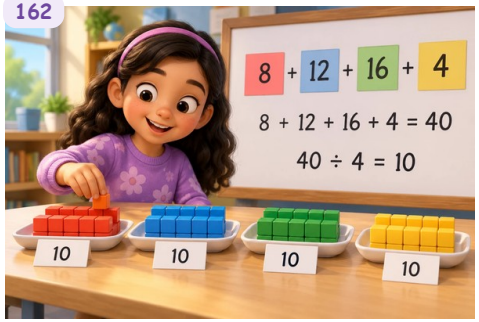

Ava explains what the most common result tells the class.

161

Ashleen levels four cube stacks to show the mean.

162

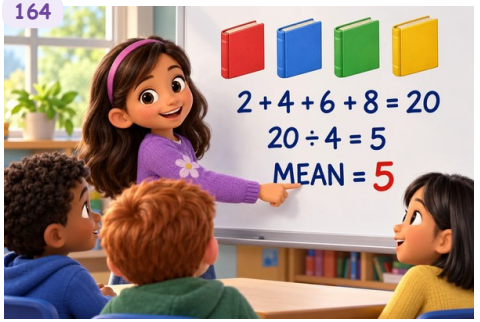

Veronica adds four values before dividing by four.

163

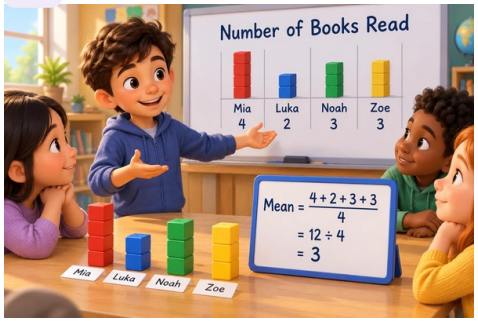

Leah shares twenty counters equally to find the mean.

164

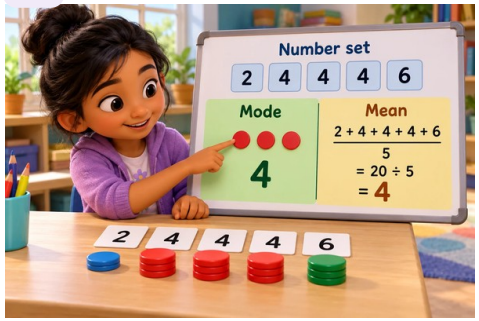

Paige adds 2, 4, 6, and 8, then divides by four to find the mean.

165

Luka explains why the mean can represent a typical value.

166

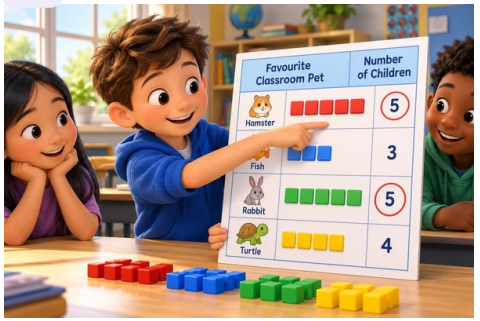

Arya compares the mode and mean of a number set.

167

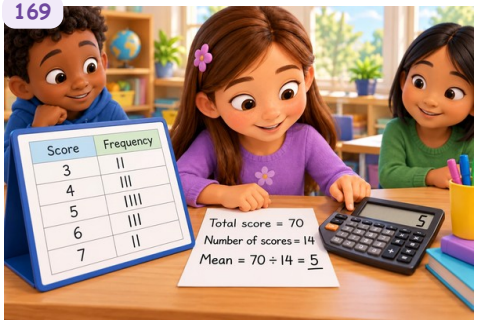

Anastasiia uses linking cubes to model the mean.

168

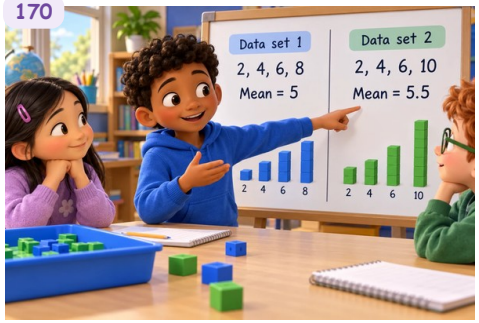

Davyd finds two modes in a set of classroom data.

169

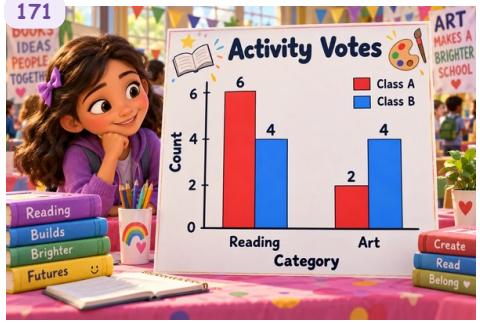

Amy checks her calculations before reporting the mean.

170

Marcus explains how the mean changes when the data change.

171

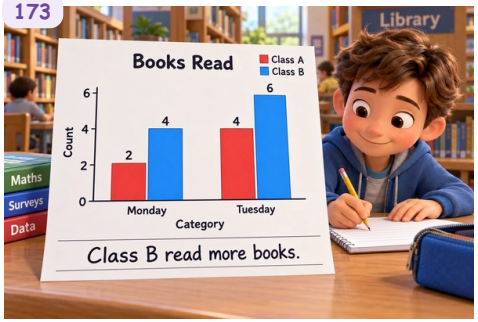

Mia creates an infographic comparing two classes' favourite school activities.

172

Aria explains how picture symbols and a key communicate survey results.

173

Peter writes a short conclusion beneath his multiple-bar graph.

174

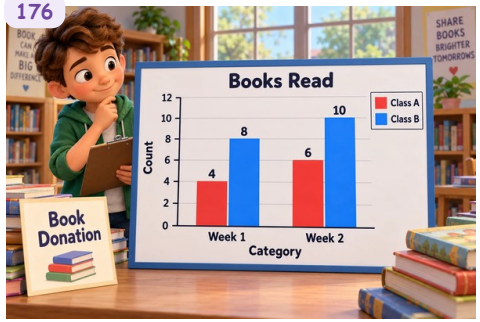

Luna uses a multiple-bar graph to compare recycling habits.

175

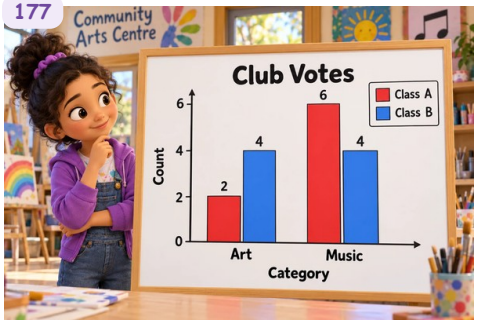

Aaliyah checks that the multiple-bar graph legend matches both classes.

176

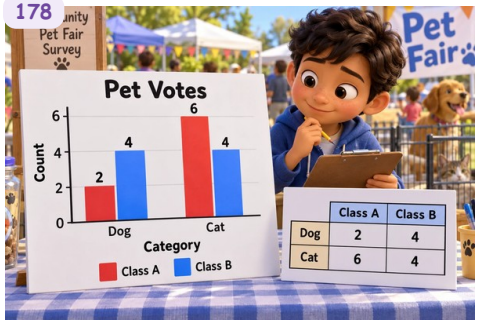

Oliver chooses a scale that fits all his multiple-bar graph data.

177

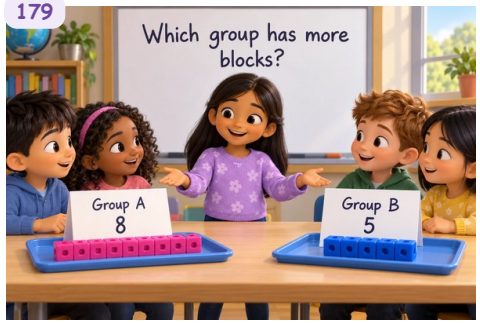

Zara counts by twos on the vertical axis of her multiple-bar graph.

178

Mateo uses a frequency table to check his multiple-bar graph.

179

Ashleen asks a question that compares the two groups' answers.

180

Priya explains how two classes' game votes support their playground choice.

181

Mateo describes the chance of drawing each counter colour.

182

Zara calls rolling a seven on one standard die impossible.

183

Ben explains why drawing a red counter from his bag is certain.

184

Luna compares heads and tails as equally likely coin outcomes.

185

Peter explains why the mostly blue spinner is more likely to land on blue.

186

Jackson explains why the all-red spinner cannot land on blue.

187

Aaliyah compares the likelihood of the classroom event cards.

188

Priya explains how four equal spinner sections give fair colour chances.

189

Chloe compares the chance of selecting two coloured blocks.

190

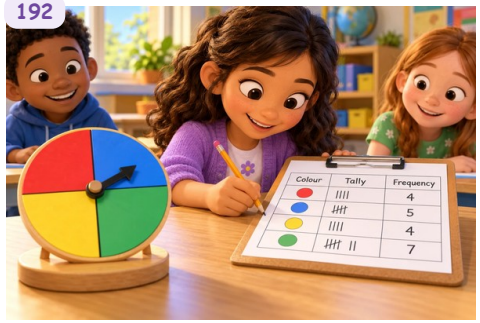

Amir draws a red counter from an explorer bag containing only red counters.

191

Ruby predicts what might happen when she rolls a die.

192

Sofia compares the frequencies in her twenty recorded spinner results.

193

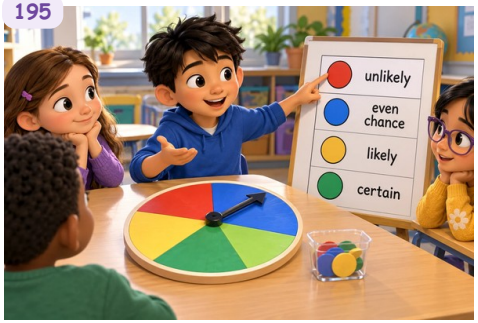

Noah compares his green prediction with the spinner results.

194

Isabella explains why the two sets of spinner results differ.

195

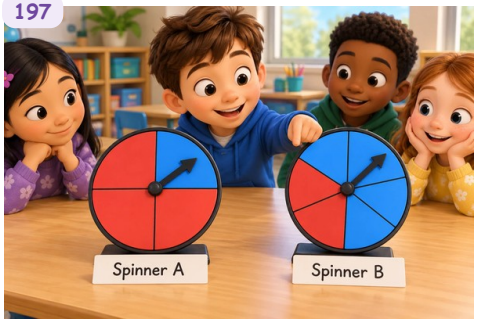

Kai describes his classroom game with precise probability words.

196

Amara compares the bags to find the greater chance of red.

197

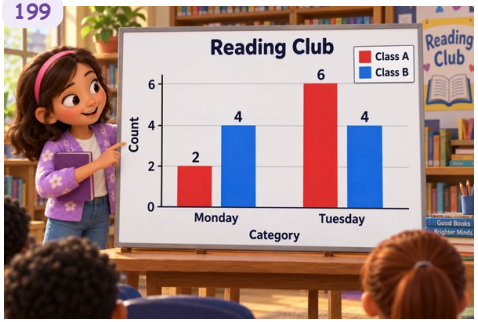

Ethan chooses the spinner with more blue for a blue-winning game.

198

David explains how his multiple-bar graph can help classmates choose a game.

199

Hannah presents a multiple-bar graph with a clear title and accurate data.

200

Ruby explains how class votes helped everyone choose a fair game.

201

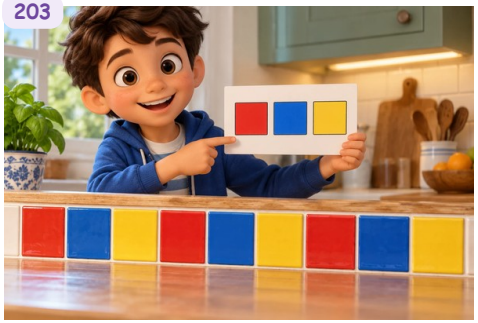

Mia made a repeating pattern with three red blocks and two blue blocks.

202

Ben used triangles, squares, and circles to create a repeating pattern.

203

Peter identified the pattern rule in a row of coloured tiles.

204

Luna noticed that the same four shapes repeated throughout the pattern.

205

Olivia extended a repeating pattern by adding the next six shapes.

206

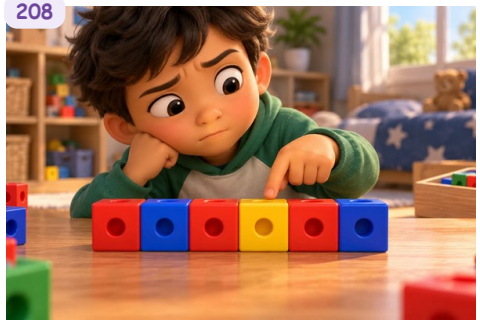

Ethan created a pattern with two red beads, one green bead, and three yellow beads.

207

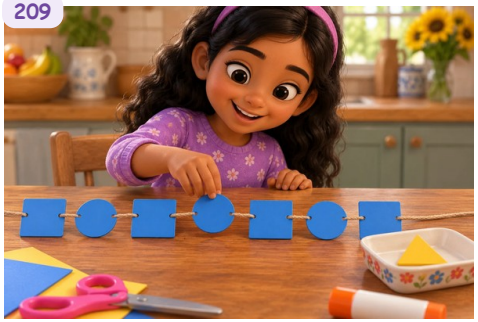

Sofia explained why a group of shapes was the pattern core.

208

Noah found a mistake in a repeating pattern of coloured cubes.

209

Aisha corrected the pattern by replacing the wrong shape.

210

Liam created an ABB pattern using circles and triangles.

211

Emma built an ABCD pattern using four different colours.

212

Lucas compared two repeating patterns to find their similarities.

213

Ava predicted which shape would appear in the twentieth position.

214

Daniel used a pattern rule to determine the colour of the twelfth tile.

215

Grace created a repeating pattern that included five different objects.

216

Mason described a pattern using letters instead of colours.

217

Chloe changed a picture pattern into a pattern made with sounds.

218

Leo represented a repeating pattern using movements and claps.

219

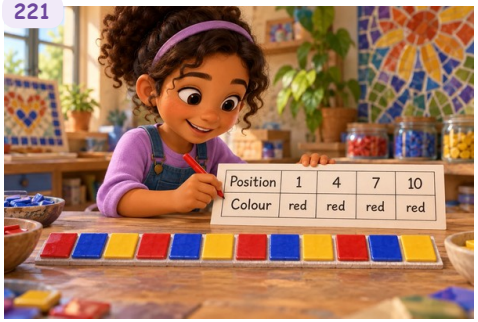

Isabella discovered that every fourth shape in her pattern was a star.

220

Henry explained how he knew the pattern would continue.

221

Amelia used a table to record the positions of red tiles.

222

Jackson noticed that blue beads appeared at positions three, six, and nine.

223

Aria created two different patterns that followed the same pattern rule.

224

William used coloured counters to demonstrate an AABBC pattern.

225

Zoe extended a repeating pattern without using additional blocks.

226

Caleb identified the missing shapes in a complicated repeating pattern.

227

Harper predicted the fifteenth object by examining the pattern core.

228

Elijah created a pattern with a core of six different shapes.

229

Ruby explained how the repeating pattern could continue forever.

230

Nathan translated a colour pattern into a pattern of letters.

231

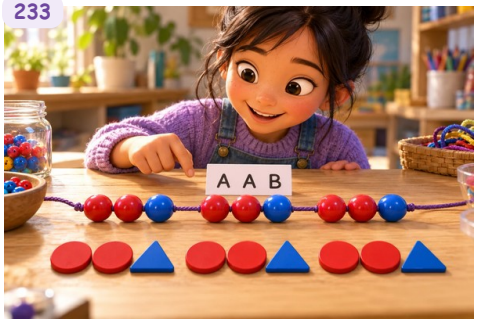

Victoria represented an ABC pattern using three different actions.

232

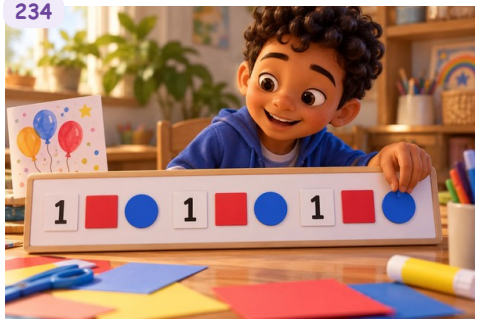

Samuel found the shortest group of objects that repeated.

233

Hannah noticed that the same pattern rule worked with different materials.

234

Isaac created a repeating pattern using numbers, shapes, and colours.

235

Layla checked whether every group followed the same repeating rule.

236

Gabriel compared an ABC pattern with an AABB pattern.

237

Ella used her knowledge of the pattern core to identify the thirtieth shape.

238

Oliver explained why a pattern with random colours was not repeating.

239

Maya created a repeating pattern and challenged her partner to identify its rule.

240

Benjamin used a repeating pattern to design a colourful classroom border.
